Key
grey box: observed in the data used (HBSC aggregates)
white box: observable with other designs
dashed ellipse: latent
double box: tie, a collider that peer-effect analyses condition on
thick line: influence, what b is meant to represent
dashed line: shared environment, homophily (also load on b)
open arrowhead: non-social routes (load on α)
dotted line: reverse causation
thin grey line: other dependencies and model transitions
Shared environment (school, cohort, period, platform diffusion)
shared environment (loads on b)
Access and platform exposure of i (features, feeds)
platform route (α)
shared environment
Mental health of i (earlier)
reverse causation (α, σ)
Sub-threshold symptoms of i (state A)
σ
Problematic use of i (state I, SMDS 6+)
association (not modelled)
Mental health of i (later)
influence (b)
Friend j's problematic use
γ₂
δ
Recovered history of i (state R)
Sex
Vulnerability of i (stable traits, earlier symptoms)
individual route (α)
Age
homophily
tie carries influence
Vulnerability of friend j
Friendship tie i - j
assortative mixing
